

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Currently Amended) A method of sharing database objects between a source datastore and a target datastore, comprising the following steps:

linking specifying at least one object dimension in [a] the source datastore to ~~link to in~~ an object in the [a] target datastore;

specifying a persistence model for controlling how changes to the linked source object are handled by persisting the target datastore, wherein the persistence model further comprising one of comprises persisting metadata in the target datastore such that changes to metadata of [an] the linked source object are in the source datastore is not updated in the target datastore until [the] object data of the linked source object is altered, persisting both metadata and data changes in the target datastore, and [or] persisting neither metadata nor data in the target datastore such that any change made to the linked source object datastore is propagated to the target datastore;

specifying a refresh policy for refreshing information in the target datastore; and,

integrating data from the object in the source datastore to the target datastore.

~~creating the target datastore, wherein the target datastore is a linked object comprising a data cube defined by the at least one specified dimension.~~

2. (Currently Amended) The method of claim 1, further comprising the step of selecting at least one group of measures in the source datastore as the linked source object ~~to link to in the target datastore.~~

3. (Original) The method of claim 1, wherein the source datastore and the target datastore are analysis databases.

4. (Original) The method of claim 3, wherein the source datastore and the target datastore are OLAP databases.
5. (Cancelled)
6. (Cancelled)
7. (Currently Amended) The method of claim 1, ~~wherein~~ the refresh policy further comprising ~~comprises~~ refreshing data each time data in the target datastore is queried.
8. (Currently Amended) The method of claim 1, ~~wherein~~ the refresh policy further comprising ~~comprises~~ refreshing data whenever a specified time interval has passed.
9. (Currently Amended) The method of claim 1, further comprising the step of specifying a filter for the target datastore.
10. (Currently Amended) The method of claim 9, wherein the filter ~~is used to limit~~ limits data accessible [from] by the target datastore to data of a specified type.
11. (Currently Amended) The method of claim 1, ~~further comprising specifying a dimension for the target datastore,~~ wherein the ~~specified dimension is not a dimension of the source~~ linked source object is a dimension in the target datastore.
12. (Currently Amended) The method of claim 1, ~~further comprising specifying a group of measures for the target datastore,~~ wherein the ~~group of measures is not a measure group of the source datastore.~~ linked source object is a measure group in the target datastore.
13. (Currently Amended) A system for sharing data between a source database and a target database, comprising [:] a module for ~~creating a target database, the target database defined by linking~~ at least one dimension object in the target database linked to a dimension an object in [a] the source database and ~~at least one measure group linked to a measure group~~

~~in the source database, the module including wherein~~ a persistence model for the target database for controlling how changes to the linked source object are handled by the target database, the persistence model further comprising one of ~~comprises~~ persisting metadata in the target ~~database data store~~ such that changes to metadata of [an] the linked source object in the source ~~data store~~ is database are not updated in the target ~~data store~~ database until the object data of the linked source object is altered, persisting both metadata and data changes of the linked source object in the target ~~data store~~ database, and [or] persisting neither metadata nor data in the target ~~data store~~ database such that any change made to the linked source object in the source ~~data store~~ database is propagated to the target ~~data store~~ database.

14. (Currently Amended) The system of claim 13, ~~further comprising a second dimension wherein the second dimension is not a dimension of the source database; the~~ linked source object is a dimension in the target database.

15. (Currently Amended) The system of claim 13, ~~further comprising a second measure group, wherein the object is a [second] measure group is not linked to a measure group in the source database; in the target database.~~

16. (Currently Amended) The system of claim 13, further comprising an analysis module for specifying the ~~at least one dimension~~ dimensions in the source database and the target database to be linked ~~to in the target database.~~

17. (Currently Amended) The system of claim 13, further comprising an analysis module for specifying the ~~at least one measure group~~ groups in the source database and the target database to be linked ~~to in the target database.~~

18. (Currently Amended) The system of claim 13, further comprising an analysis module for specifying a refresh policy ~~for determining that determines~~ when data in the target database is refreshed.

19. (Cancelled)

20. (Original) The system of claim 13, wherein the source database resides on a first computer and the target database resides on a second computer.

21. (Original) The system of claim 13, wherein the source database is associated with a first instance of an analysis module and the target database is associated with a second instance of an analysis module.

22. (Currently Amended) A computer-readable storage medium comprising computer-executable instructions for:

linking selecting at least one dimension an object in a source analysis datastore to ~~link to in an object in~~ a target analysis datastore;

selecting a persistence model for controlling how changes to the linked source object are handled by ~~persisting~~ the target analysis datastore, ~~wherein~~ the persistence model further comprising one of ~~comprises~~ persisting metadata in the target analysis datastore such that changes to metadata of [an] the linked source object are ~~object in the source datastore is not~~ updated in the target analysis datastore until [the] object data of the linked source object is altered, persisting both metadata and data changes in the target analysis datastore, and [or] persisting neither metadata nor data in the target analysis datastore such that any change made to the linked source object in the source datastore is propagated to the target analysis datastore;

selecting a refresh policy for refreshing information in the target analysis datastore;
and,

integrating data from the linked object in the source datastore to the object in the target analysis database.

~~selecting at least one group of measures in a source analysis datastore to link to in the target analysis datastore; and~~
